                FUNCTION: This enzyme converts phytoene into zeta-carotene via intermediary of phytofluene by the symmetrical introduction of double bonds at the C-11 and C-11' positions of phytoene.
                                                                                                                                                                                                                                                                                                                                                                                                                                  Pfan; PF01593; Amino oxidase; 1.

This SWISS-PROT entry is copyright. It is produced through a collaboration

-!- COFACTOR: FAD (Probable).
-!- PATHWAY: Carotenoid and chlorophyll biosynthesis.
-!- SIMILARITY: Belongs to the phytoene dehydrogenase family.

Bartley G.E., Scolnik P.A.; "Carocteria Genetic "Caroctenoid biosynthesis in photosynthetic bacteria. Genetic characterization of the Rhodobacter capsulatus Crtl protein."; J. Biol. Chem. 264:13109-13113(1989).

No. is the number of results predicted by chance to have a score greater than or equal to the score of the result being printed, and is derived by analysis of the total score distribution.

The invention relates to a method for producing carotenoid compounds. The method comprises a transformed metabolising host cell, comprising suitable levels of isopentenyl pyrophosphate and a nucleic acid molecule encoding an enzyme in the carotenoid biosynthetic pathway, under the
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                             Producing carotenoid compounds e.g. antheraxanthin and astaxanthin, by using microorganisms having a nucleic acid molecule encoding enzymes in the carotenoid biosynthetic pathway and which metabolize single carbon
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                       Q, Dicosimo DJ,

```
control of regulatory sequences, and contacting the host cell with carbon substrate to produce a caroteenoid compound. The method is useful for producing caroteenoid compounds such as antheraxanthin and astaxanthin, by using microorganism having a nucleic acid molecule encoding enzymes in the caroteenoid biosynthetic pathway and which metabolise single carbon substrates. The caroteenoids have potent anti-oxidant properties useful in diet, and aquaculture elements. The caroteenoids are also useful as compounds for potential electro-optic applications. The present sequence is Rhodococcus erythropolis ANI2 beta-caroteene ketolase (CrtO) enzyme
                                                                                                                                                                                                                                                                                        used in the invention

The invention relates to a novel isolated nucleic acid encoding a carotemoid ketolase enzyme which: (i) encodes an amino acid sequence containing all six conserved motifies of CTrO enzymes of Rhodococcus containing all six conserved motifies of CTrO enzymes of Rhodococcus errbiropolis ANIZ strain, Deinococcus radiodurans R1 strain, and acide, given in specification, or (iii) hybridises to (ii) or (ii). A nucleic acid of the invention is useful for obtaining a mucleic acid also useful for producing cyclic ketocarotenoid compounds. A chimeric gene is useful for regulating cyclic ketocarotenoid biosynthesis in an organism by introducing cyclic ketocarotenoid biosynthesis in an organism by introducing the gene into a host cell and growing the host cell under conditions whereby the carotemoid ketolase gene is expressed and the cyclic ketocarotenoid biosynthesis, where the carotenoid ketolase gene is expressed on a multicopy plasmid or is operably linked to a inducible or regulated promoter. Optionally the cyclic ketocarotenoid biosynthesis may be down regulated, where the cyclic ketolase gene is expressed in anishense orientation or is operably linked to a inducible or regulated promoter. Optionally the cyclic ketocarotemoid ketolase gene is expressed in anishense orientation or is disrupted by insertion of foreign DNA into the coding region. The present sequence represents the R. erythropolis strain ANIZ crtO polypeptide
                                                                                                                                                                                                                                                      New isolated nucleic acid encoding carotenoid ketolase enzyme, useful for producing cyclic ketocarotenoid compounds such as adonirubin, echinenone, and as probes or primers to identify nucleic acids encoding the enzyme.
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                      1 IVGEMBAFAPGFTDSVLDRFIQTPRDIBSELGMIGGNVMHVBMSLDQMMLWRPLPELSGH 480

Cheng Q, Tao L;

2003-300493/29. WPI; 2003-300493 N-PSDB; ABZ75461 New isolated nucleic acid encoding carotenoid ketolase enzyme, useful for producing cyclic ketocarotenoid compounds such as adonirubin, echinenone, and as probes or primers to identify nucleic acids encoding the enzyme.

Claim 15; Page 69-71; 90pp; English.

The invention relates to a movel isolated nucleic acid encoding a carotenoid ketolase enzyme which: (1) encodes an amino acid sequence containing all six conserved motifs of Crto enzymes of Rhodococcus erythropolis AN12 strain, Deinococcus radiodurans R1 strain, and scids, given in specification; or (iii) encodes a sequence of 532 amino acids, given in specification; or (iii) hybridises to (1) or (ii). A nucleic acid of the invention is useful for obtaining a nucleic acid of the invention is useful for obtaining a nucleic acid of the invention square enzyme. A nucleic acid of the invention square enzyme. A nucleic acid of the invention gene is useful for regulating cyclic ketocarotenoid biosynthesis in an organism by introducing the gene into a host cell and growing the host cell under conditions whereby the carotenoid ketolase gene is expressed and the cyclic ketocarotenoid biosynthesis; where the carotenoid ketolase gene is expressed and the cyclic ketocarotenoid biosynthesis; where the carotenoid ketolase gene is overexpressed on a multicopy plasmid or is operably linked to a inducible or regulated promoter. Optionally the cyclic ketocarotenoid biosynthesis may be down regulated, where the carotenoid ketolase gene is expressed in antisense orientation or is disrupteed by insertion of foreign DNA into the coding region. The present sequence represents the D. radiodurans strain R1 crtO polypeptide

New isolated nucleic acid encoding carotenoid ketolase enzyme, useful for producing cyclic ketocarotenoid compounds such as adonirubin, echinenone, and as probes or primers to identify nucleic acids encoding the enzyme.

Disclosure, Page 72-74, 90pp, English.

The invention relates to a novel isolated nucleic acid encoding a carotenoid ketolase enzyme which: (i) encodes an amino acid sequence containing all six conserved motifs of CrtO enzymes of Rhodococcus erythropolis AN12 strain, Deinococcus radiodurans R1 strain, and

Symechocystis sp. PCC6803 strain, (ii) encodes a sequence of 532 amino acid, given in specification; or (iii) hybridises to (i) or (ii). A nucleic acid of the invention is useful for obtaining a nucleic acid encoding a carotenoid ketolase enzyme. A nucleic acid of the invention is encoding a carotenoid ketolase enzyme. A nucleic acid of the invention is also useful for producing cyclic ketocarotenoid compounds. A chimeric gene is useful for regularing cyclic ketocarotenoid biosynthesis in an organism by introducing the gene into a host cell and growing the host cell under conditions whereby the carotenoid ketolase gene is expressed and the cyclic ketocarotenoid biosynthesis; where the carotenoid ketolase gene is expressed on a unliciopy plasmaid or is carotenoid ketolase gene is overspressed on a multicopy plasmaid or is carotenoid ketolase gene is overspressed on a multicopy plasmaid or is carotenoid ketolase gene is overspressed on a regulated, where the carotenoid ketolase gene is expressed in antisense orientation or is operably linked to a inducible or regulated promoter. Optionally the cyclic ketocarotenoid biosynthesis may be down regulated, where the carotenoid ketolase gene is expressed in antisense orientation or is disrupted by insertion of foreign DNA into the coding region. The present sequence represents the Synechocystis sp. strain PCC6803 crto polypeptide Sequence 542 AA; ត្តម្ភិទីទីពិពីពិព័ព្ធពេលបាន

830 Primers useful for synthesizing full length cDNA clones and their use in genetic manipulation.

Claim 8; SEQ ID NO 3528; 1380pp + Sequence Listing; English.

The invention relates to primers for synthesising full length cDNA clones. 330 cDNA molecules encoding a human protein have been isolated and nucleotide sequences of 5'- and 3'-ends of the cDNA molecules have been determined. Primers for synthesising the full length cDNA are useful for clarifying the function of the protein encoded by the cDNA. The full length clones were obtained by construction of full length enriched cDNA libraries that were synthesised by the oligo-capping method. The primers enable the production of the full length cDNA easily without any special methods. The present sequence is a polypeptide encoded by a full length not form part of the printed specification, but was obtained in CD-ROM format directly from EPO

                                                                                                                                                     The sequence represents a novel human oxidoreductase polypeptide of the invention, designated OXIRED-8. The proteins of the invention have cytostatic, neuroprotective, cardiant, immunosuppressive, antiinflammatory, neuroleptic, and endocrine activity. The polypeptide is used in the diagnosis and treatment of disorders associated with disorders include cancer, cell proliferative disorders, neurological, cardiovascular, autoimmune/inflammatory and metabolic disorders. Note: The sequence data for this patent did not form part of the printed security in the sequence data for this patent did not form part of the printed security contraction, but was obtained in electronic format directly from WIPO

The invention relates to 971 novel human CDNA sequences (ADC29919-ADC30889) and the polypeptides they encode (ADC30890-ADC31860). The invention also relates to nucleic acid sequences over 99\$ identical with the novel human cDNAs. The invention additionally encompasses expression vectors and host cells comprising a mucleic acid of the invention; the recombinant production of a polypeptide of the invention; an antibody against a polypeptide of the invention; and methods of invention discloses methods of polympeptide of the invention; and methods of invention further discloses methods of polypeptide of the invention. The invention further discloses methods of perventing, treating or invention further discloses methods of polypeptide of the invention. The invention methods for the invention; and/or monoclonal antibodies for carrying out the methods of the invention or and/or methods for the invention of compounds that modulate the invention are invention; methods for the polypeptides and/or polypeptide; and 767 contig sequences corresponding to the cDNA sequences of the invention are inventily sequences corresponding to the cDNA sequences of the invention are useful in diagnostics, drug screening, for essenting (ADC32627) and the polypeptides of the invention are useful in diagnostics, drug screening, forensics, gene mapping, in the identification of mutations responsible for genetic disorders or other traits, for assessing biodiversity, and in producing many other types of disease and other neurodegenerative diseases, anaemia, platelet disorders, wounds, burns, ulcers, osteoporosis, autoimmume diseases or cancer. The nucleic acids may also be used as hybridisation probes or cancer. The nucleic acids may also be used as hybridisation probes or cancer. The nucleic acids may also be used as molecular weight markers, and in the recombinant production of a procein. The programmers, and in the recombinant production of apprehences the present sequence represents a specifically business. New polynucleotide and polypeptide useful for diagnosing, preventing or treating conditions such as neurodegenerative diseases, anemias, platelet disorders, wounds, burns, ulcers, osteoporosis, autoimmune diseases or Tang TY, Zhang J, Ren F, Xue AJ, Zhao QA, Zhou P, Ghosh M, Wang D, Ma Y, Asundi V, Haley-Vicente D, Drmanac RT; Claim 20; SEQ ID NO 1614; 1185pp; English 2003-371981/35. WPI; 2003-371981/35. N-PSDB; ADC32385 New polynucleotide and polypeptide useful for diagnosing, preventing or treating conditions such as neurodegenerative diseases, anemias, platelet disorders, wounds, burns, ulcers, osteoporosis, autoimmune diseases or cancer.

Example 2; SEQ ID NO 3234; 1185pp; English

The invention relates to 971 novel human cDNA sequences (ADC29919-ADC3089) and the polypeptides they encode (ADC30890-ADC31860). The invention also relates to mucleic acid sequences over 99% identical with the novel human cDNAs. The invention additionally encompasses expression vectors and host cells comprising a nucleic acid of the invention; the recombinant production of a polypeptide of the invention; an antibody against a polypeptide of the invention; an antibody against a polypeptide of the invention; and methods of identifying a compound which binds to a polypeptide of the invention. The invention further discloses methods of peventing, treating or invention and methods of peventing, treating or invention and antibodies for carrying out the methods of the invention; methods for the identification of compounds that modulate the invention, methods for the identification of compounds that modulate the invention, methods for the identification of compounds that modulate the expression or activity of the polynucleotide and/or polypeptide; and 767

contig sequences corresponding to the cDNA sequences of the invention (ADC31961-ADC32627) and the polypeptides encoded by the contigs (ADC32628 ADC3394). The nucleic acids and polypeptides of the invention are useful in diagnostics, drug screening, forensics, gene mapping, in the identification of mutations responsible for genetic disorders or other traits, for assessing biodiversity, and in producing many other types of data and products dependent on DNA and amino acid sequences. They are also used for treating diseases such as Parkinson's disease, Alzheimer's disease and other neurodegenerative diseases, anaemia, platelet disorders, wounds, burns, ulcers, osteoporosis, autoimmume diseases or cancer. The nucleic acids may also be used as hybridisation probes or primers, and in the recombinant production of a protein. The polypeptides are also useful in generating antibodies, as molecular weight markers, and as food supplements. The present sequence represents a human contigenced polypeptide sequence used in an example of the invention. Note: The bequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from WIPO
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                    ftp.wipc.int/pub/published_pct_sequences

```
The present invention provides a number of nucleotide and protein sequences from the Coryneform bacterium Corynebacterium glutamicum. These are useful for identifying the mutation point of a gene derived from a mutant of coryneform bacterium, measuring expression amount and analysing the expression profile or expression pattern of a gene derived from Coryneform bacterium, and identifying a homologue of a gene derived from coryneform bacterium. Coryneform bacteria are useful for producing amino acids, nucleic acids, vitamins, saccharides and organic acids, particularly 1-1ysine. The present sequence is a protein described in the exemplification of the invention. Note: The sequence data for this patent did not form part of the printed specification, but was obtained in electronic format directly from the European Patent Office
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                218 WPVAVGGSGRIVDALVNVINHHGGTIHCDSQIDSL-----SQFRDTDA--IILN 264

                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           The invention relates to a novel isolated polypeptide having carotenoids isomerase catalytic activity, comprising a sequence at least 75 % similar to a 615 residue CRTISO amino acid sequence, given in the specification, as determined using the Standard protein protein BLAST (blastp) software of the NCBI. The novel polypeptide is useful for producing the all-trans geometric isomers of cis-carotenoids, including phytocene, phytofluene, zeta-carotene, neurosporene and lycopene. The polypeptide enables carotenoid biosynthesis in plants in the dark and in non-photosynthetic tissues. This sequence represents a synechocystis protein relating to the carotenoid isomerase catalytic polypeptides of the invention
                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                                           HIMIRHSGIIEELGLGAHGLRYIDC------DPWAFAPPAGTDGPGIVFHR 106
